

Fonction : op_free_process_list

- **Résumé de la fonction:**

Cette tâche libère proprement toute la mémoire associée aux processus du système en parcourant et supprimant chaque PCB de la liste des processus.

- **Code en C:**

```
TASK op_free_process_list(PROCESS_MANAGER* self) {
    if (self == NULL || self->process_table_head == NULL) {
        return TASK_SUCC;
    }

    PCB* current = self->process_table_head;
    while (current != NULL) {
        PCB* next = current->pid_sibling_next;
        free(current);
        current = next;
    }

    self->process_table_head = NULL;
    return TASK_SUCC;
}
```

- **Explication détaillée:**

1. *Vérification initiale:*

```
If (self == NULL || self->process_table_head == NULL) {  
    return TASK_SUCC;  
}
```

2. *Parcours de la liste des processus:*

```
PCB* current = self->process_table_head;
```

3. *Libération de chaque processus:*

```
while (current != NULL) {  
    PCB* next = current->pid_sibling_next;  
    free(current);  
    current = next;  
}
```

4. *Réinitialisation de la table des processus:*

```
self->process_table_head = NULL;
```
